autonomous parvovirus, minute virus of mice Nucleic Acids Res. 13 (10), 3617-3633 (1985) 85242059
385542.
For the fibroblast-specific strain (MVMp) sequence see <PAMVM2>.
The genomes of MVMp and MVMmi (immunosuppressive variant) have more than 96% of their sequence in common.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a DNA encoding parvovirus non-structure protein 1 (NS1) variant (T394A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene
                                 The present sequence is a parvovirus non-structure protein (NSI) variant (T394A) DNA fragment. The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-NUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 ATTIGCIGICITITIAAACAGACAAGGAGGCAAAAGAAAIGCIGTITIAITITCAIGGACCA 60

The present sequence is a wild type DNA encoding parvovirus non-
structure protein 1 (NS1). The present invention relates to the variants
of the parvovirus non-structure protein (NS1) having a shifted
equilibrium between the DNA replication and transcription activities, and
the cytotoxicity activity. These variants are useful as toxins for
treating tumoural diseases. The variant DNAs are useful as vectors for
gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a DNA encoding parvovirus non-structure protein (NSI) variant (T463A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cyclocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AVG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

This viral DNA is isolated from a non- attenuated CPV. The DNA is preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM3Z or pGEM5Z. The host cells to be transfected ar selected from Norden Liaboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or canine A72 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Parvovirus; dog; vaccine; CPV; myocardial disease; enteric disease; ds;

(NS1) variant (S283A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

                                                                       This viral DNA is isolated from an attenuated CPV. The DNA is preferably derived from vB1440. The DNA is cloned into a vector which is used to transfect a host cell. The vector used is preferably pGEM3Z or pGEM5Z. The host cells to be transfected ar selected from Norden Laboratory feline kidney cells, mink lung cells, Madin-Darby canine kidney cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= c

Canine parvovirus DNA carrying specific attenuating mutation(s) - used as vaccines for protection against parvovirus and feline pan-leukopenia virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Attendated viruses are obtained by serial passage of the virulent CPV type 2b isolate 39 in NLFK feline kidney host cells. They have one or more of the sequence relaterations indicated in the sequence relative to the sequence relative to a claimed virus from the 65th passage) wild-type CPV-2b (see AAT88320). A claimed virus from the 65th passage (deposited as ATCC VR 2528) contains all 6 mutations. The DNA from attenuated CPV strains (see also AAT88324) is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The attenuated viruses can be used in dogs as a vaccine to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protect against CPV disease, or more generally in cats and minks to protect against feline panleukopenia virus and mink enteritis virus. The vaccines protect against the currently prevalent CPV-2b type (and all extant strains of types 2 and 2a), providing a long term immune response. (NB. this sequence was created by adaptation of the wild-type CPV-2b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This DNA molecule encodes an annenuated canine parvovirus (CPV) genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C or T in CPV-39 (passage 5)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        parvovirus; CPV; attenuation; vB1440; vaccine; dog; panleukopenia virus; mink enteritis virus; infection; ds

```
This DNA sequence comprises an attenuated virus genome derived by serial passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate passaging (60 times) of virulent canine parvovirus (CPV) type 2b isolate (C 39 in NLFK feline kidney host cells. The attenuated virus is designated the NELATOR 2489). It contains 4 mutations relative to the sequence (see AAT88320) of the control (5th passage) wild-type CPV-2b. 2 Mutations at micleotide 59 introduces an A into a G-C rich region within the tip of the hairpin, disrupting the base pairing in one of the 2 small internal companient to the mismatched bubble (file)-flop) sequence within the top adjacent to the mismatched bubble (file)-flop) sequence within the CC adjacent to the mismatched bubble (file)-flop) sequence within the cut an attenuated CPV strains (see also AAT88321) is used for the production of infectious molecular DNA clones, which, in the time, an be transfected into cells to generate master stocks of the against CPV disease, or more generally in cats and minks to protect against the currently prevalent cats and minks to protect protect against the currently prevalent cats and minks in the variant contect against the currently prevalent term immune response.

CC (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                       Canine parvovirus DNA carrying specific attenuating mutation(s) - used as vaccines for protection against parvovirus and feline pan-leukopenia virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This DNA sequence comprises the genome of virulent canine parvovirus type 2b (CPV-2b) isolate 39, obtained after 5 serial passages in NLFK feline 2b (CPV-2b) isolate 39, obtained after 5 serial passages in NLFK feline 2c (ArCC VR 2489) (see AAT88324) from the 60th passage, and a claimed virus (ArCC VR 2489) (see AAT88324) from the 60th passage, and a claimed virus (see AAT88321) derived from the 65th passage (ATCC 2528). These cespectively contain 4 and 6 mutations in comparison to the virulent 5th passage virus. The DNA from attenuated CPV-2b strains is used for the production of infectious molecular DNA clones, which, in turn, can be transfected into cells to generate master stocks of the virus. The CPV disease, or more generate master stocks of the virus. The CPV disease, or more generally in cats and minks to protect against currently prevalent cPV-2b vype (and all extant strains of types 2 and 2a), and provide a long term immune response. (Updated on 17-0CT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                          Canine parvovirus DNA carrying specific attenuating mutation(8) - used as vaccines for protection against parvovirus and feline pan-leukopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1422 İGİÇİTİTAAATAGACAAĞGTĞTĞTAAAGAAATACAĞTTCİTİTİTĞĞAÇĞA 1475

The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polymuclectides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable trains as compared to a reference plant, such as an alteration in a plant growth characteristic, e.g. growth rate, germination rate of seeds, vigor of plants and seedlings, or leaf and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the cDNAs of the invention.
                                                                                                                                   New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       493 ATTTGCAGAGTGTTCAATAAACAGGAGACAGAAAAAATGTTGGATTAATCCAT 546

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       development of vaccinal immunity against parvovirus infection. Also claimed are DNA sequences wholly or partly duplicative of defined sequences. The polypeptides are used in vaccines for conferring protection against parvovirus infections in man and animals. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABP72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions

Claim 1; SEQ ID NO 28573; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Prosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

FEATURES

ORIGIN

```
(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwb/2 (gil #4732114|gbh/R129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. ooli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

//site_l: EcoRI; Site_2: Not1; This normalized
KS(+): Site_l: EcoRI; Site_2: Not1; This normalized
Ilbrary was constructed from 1 million independent clones.
CDNA synthesis was initiated using an oligo(df) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
EcoRI; size-selected, and cloned into the NotI and EcoRI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., pNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 310,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US. OB-647-655-2

Sequence 2, Application US/08647655

Patent No. 588585

GENERAL INFORMATION:
APPLICANT: Parrish, Colin R.
APPLICANT: Gruenberg, Allen
APPLICANT: Gramichael, Leland E.
TITLE OF INVENTION: Attenuated Canine Parvovirus Vaccine
INUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas

The present sequence is a peptide fragment of parvovirus non-structure protein 1 (NS1) variant (T394A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NS1; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; mutant; mutein; variant.

Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                       NS1; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; mutant; mutein; variant.

                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is parvovirus non-structure protein 1 (NS1) variant (T394A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as toxins for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NS1; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; mutant; mutein; variant.

                                                                                                                                                                                                                                                                                         The present sequence is parvovirus non-structure protein 1 (NS1) variant (T363A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                   Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

The present sequence is a parvovirus wild-type non-structure protein 1 (NS1). The present invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and

This invention relates to a method of identifying a compound which modulates THAP (THANCOS (death) Associated Protein)-mediated activities. The invention also relates to genes and proteins of the THAP family and uses thereof. Coordination of cell proliferation and cell death is required for normal development and tissue homeostasis in multicellular organisms. A defect in these two processes is a fundamental requirement or tunning modulate THAP1 is a pro-apoptotic protein and therapeutics which modulate THAP1 activity may be cytostatic. The sequences of the invention may prove useful for gene therapy. The method is useful for preparing a composition for treating cancer. The present sequence is the partial amino acid sequence of the human THAP4 protein which was used for homology purposes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2003-532998/50.

                                                         The present sequence is parvovirus non-structure protein 1 (NSI) variant (S283A). The invention relates to the variants of the parvovirus non-structure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as toxins for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a test compound that modulates THAP-mediated activities for treating cancer by determining whether the test compound selectively modulates the activity of the THAP-family polypeptide.

The invention also relates to genes and proteins of the THAP family and uses thereof. Coordination of cell proliferation and cell death is required for normal development and tissue homeostasis in multicellular organisms. A defect in these two processes is a fundamental requirement for tumourigenessis. THAP1 is a pro-apoptotic protein and therapeutics which modulate THAP1 activity may be cytostatic. The sequences of the invention may prove useful for gene therapy. The method is useful for perparing a composition for treating cancer. The present sequence is the amino acid sequence of a mouse orthologue of the human THAP proteins which is related to the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                            modulates THAP (Trancos (dearh) Associated Protein)—mediated activities. The invention also relates to genes and proteins of the THAP family and uses thereof. Coordination of cell proliferation and cell death is required for normal development and tissue homeostasis in multicallular organisms. A defect in these two processes is a fundamental requirement for tumourigenesis. THAP1 is a pro-apoptotic protein and therapeutics which modulate THAP1 activity may be cytostatic. The sequences of the invention may prove useful for gene therapy. The method is useful for amino acid sequence of a mouse orthologue of the human THAP proteins which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                   Identifying a test compound that modulates THAP-mediated activities for treating cancer by determining whether the test compound selectively modulates the activity of the THAP-family polypeptide.

The invention relates to a novel isolated human secreted polypeptide (SECP). An SECP of the invention has neuroprotective, relaxant, antitipated, articipated, cytostatic, dermatological, immunosuppressive, antitihlammatory, thyromimetic, antiallergic, cerebroprotective, gastrointestinal, hepatotropic, antiallergic, cerebroprotective, gastrointestinal, hepatotropic, antiparasitic, fungicide, protozoacide, virucide, uropathic, antiparensitic, fungicide, protozoacide, virucide, uropathic, antiparensitic, fungicide, protozoacide, oricide, uropathic, antiparensitic, fungicide, protozoacide, oricide, antiparensitic, antiparensitic, fungicide, protozoacide, oricide, antiparensitic, antiparensition may have a use in gene therapy, and a polypeptide may act as either a SECP agonist or antagonist. The polypeptide are useful in diagnosing, preventing, and treating disorders associated with an abnormal expression or activity of SECP, such as neurodegenerative disorders, muscular disorders, endocrine disorders, infections, cardiovascular disorders, or hepatic, candiovascular disorders, and disorders, and modulate the activity of SECP, and modulate the activity of SECP, and modulate the activity of SECP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The polynucleotides can be used to create humanized animals or transgenic animals to model human disease. The sequences shown in ABR58489-ABR58520
gastrointestinal, hepatotropic, nephrotropic, anticonvulsant, fungicide, antiparkinsonian, antibacterial, antiparasitic, protozoacide, virucide, uropathic, antirheumatic, cardiant, cardiovascular, anti-HIV, nootropic, gene therapy, neurodegenerative disorder, muscular disorder, cancer, endocrine disorder, immunological disorder; gastrointestinal disorder, renal disorder, infection, cardiovascular disorder; hepatic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New SECP polypeptides, useful for diagnosing, preventing, and treating disorders associated with an abnormal expression or activity of SECP, e.g. neuromuscular, immunological, cardiovascular disorders, cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lehr-Mason PM, Tran UK, Duggan BM;

This invention relates to a method of identifying a compound which modulates THAP (THANCOS (death) Associated Protein)-mediated activities. The invention also relates to genes and proteins of the THAP family and uses thereof. Coordination of cell proliferation and cell death is required for normal development and tissue homeostasis in multicellular organisms. A defect in these two processes is a fundamental requirement for tumourigenesis. THAP1 is a pro-apoptotic protein and therapeutics which modulate THAP1 activity may be cytostatic. The sequences of the invention may prove useful for gene therapy. The method is useful for preparing a composition for treating cancer. The present sequence is the amino acid sequence of the human THAP4 protein which is related to the

The polynucleotides can be used to create humanized animals or transgenic animals to model human disease. The sequences shown in ABRS8489-ABRS8520
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated human secreted polypeptide (SECP). An SECP of the invention has neuroprotective, relaxant, antithyroid, antidiabetic, cytostatic, dermatological, immunosupressive, antinilammatory, thyromimetic, antiallergic, cerebroprotective, gastrointestinal, hepatotropic, nephrotropic, anticonvulsant, antiparterial, antiparasitic, fungicide, procacide, vircide, uropathic, antirheumatic, cardiant, cardiovascular, anti-HHV, and nootropic activity. A polymotleotide of the invention may have a use in gene therapy, and a polymeptide may act as either a SECP agonist or antagonist. The polypeptide or its fragments, and the polymeticelectide encoding the polypeptide are useful in diagnosing, preventing, and treating disorders associated with an abnormal expression.
                                                                                                                                                                                                                                                 antidiabetic; cyfostatic; dermatological; immunosuppressive; antinflammatory; thyromimetic; antiallergic; cerebroprotective; asstrontestinal; hepatotropic; nephrotropic; anticonvulsant; fungicide; antipartkinsonian; antibacterial; antiparasitic; protozoacide; virucide; uropathic; antirheumatic; cardiant; cardiovascular; anti-HIV; nootropic; gene therapy; neurodegenerative disorder; muscular disorder; cancer; endocrine disorder; immunological disorder; gastrointestinal disorder; renal disorder; hepatic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New SECP polypeptides, useful for diagnosing, preventing, and treating disorders associated with an abnormal expression or activity of SECP, e.g. neuromuscular, immunological, cardiovascular disorders, cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                        The herpes helper virus (HHV-6) transcription suppressor (ts) gene shuts off transcription of the HIV long terminal repeat promoter and of the H-ras gene. A new gene therapy method for treating a subject at risk of or sulfering from a disease state associated with oncogenic transformation or lentivirus infection comprises delivering a vector comprising a polymucleotide sequence encoding a transcription suppressor (especially the HHV-6 ts gene) to the patient's cells. The method is used for the prevention and treatment of viral cancers and lentivirus (especially infection. Cancers which may be treated include those caused by members of the ras oncogene family and cancers associated with human papilloma virus (HPV), bovine papilloma virus (BPV) and HTLV-1 (human papilloma virus (HPV) to some papilloma virus (BPV) and HTLV-1 (human for cell lymphotropic virus-1). The present sequence is the protein encoded by the HHV-6 ts gene; it can be used directly to treat the same diseases.
                                                                                                                                                                                                                                                                                                                                                                                 Gene therapy for treatment of viral cancers or lentivirus infection - by transfection of cells with transcription suppressor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury;

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polynucleotide or the compound to injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to pyrokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammanomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or readment of canner, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                         Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory, cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 20; SEQ ID NO 25456; 1399pp + Sequence Listing; English.
                   Human polypeptide SEQ ID NO 25456.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

noncapaid protein NS1 - mink enteritis virus (strain Abashiri)

C)Species: mink enteritis virus, MEV
C)Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 16-Jun-2000
C)Accession: A38350
R;Kariatsumari, T. Horiuchi, M.; Hama, E.; Yaguchi, K.; Ishigurio, N.; Goto, H.; Shinage J. Gen. Virol. 72, 867-875, 1991
A;Title: Construction and nucleotide sequence analysis of an infectious DNA clone of the A;Reference number: A38350; MUID:91202123; PMID:2016597
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
